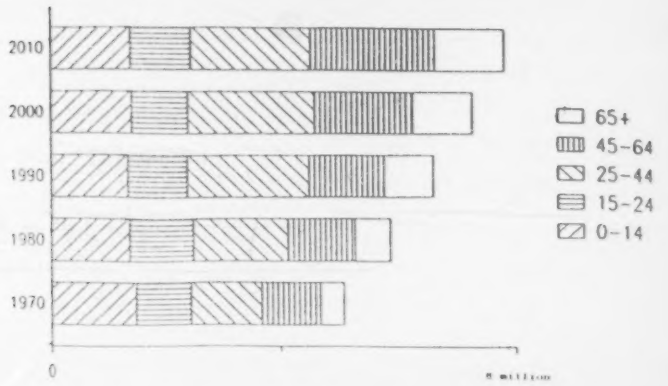
1987 PROJECTION SERIES



NORTH CAROLINA POPULATION PROJECTIONS

The fundamental basis for projections of North Carolina's population is the population base reported in the 1980 federal census. The "aging forward" of this base dominates these age, race, and sex specific projections. The median age is rapidly increasing (moving from 26.5 in 1970 to 29.6 in 1980, and projected to reach 36.6 by 2000). This effect causes projected births to rise and then fall, in spite of steadily rising fertility. It causes projected deaths to increase rapidly, in spite of improving mortality. Only the assumption of fairly constant net in-migration is not affected by it.

BIRTH, DEATH, AND MIGRATION ASSUMPTIONS

North Carolina's total white and nonwhite fertility rates are currently significantly less than the national average. It was assumed that current ratios of state to national fertility for each age and race group, would remain constant through the year 2010.

North Carolina death rates vary significantly from those of the nation as a whole, being higher for some age, race, and sex groups and lower for others. Over the next century, North Carolina death rates are assumed to converge toward national rates, reaching full equality by the year 2080.

Net migration to North Carolina is projected to follow recent experience (1980-1986). During the 80's and 90's decades, net migration should average approximately 38,500 per year into the state, with a slightly larger net influx for the 80's and a slightly smaller net migration for the 90's.

METHODOLOGY:

BASIC TREND PROJECTIONS BY COUNTY

The basic technique used to develop county trend projections by age, race, and sex for this series is the Adjusted Migration technique. This technique is based on the assumption that, while out-migration is proportional to the number of persons present at the beginning of the projection decade, in-migration is independent of the number of persons currently present. The projected net migration is added to the "Cohort-Survived" population (the population projected assuming zero net migration) to yield the final projected population. This technique cannot be used to project the populations of the two youngest age groups (0-4 and 5-9). For these age groups two steps were used. First, births by race and half decade were obtained by applying projected age and race specific birth rates for each year to projected numbers of women of child-bearing ages. It was assumed that deviations in individual county birth rates from the corresponding state birth rates between 1975 and 1985 would continue all the way to 2010. Second, sex-at-birth ratios and projection ratios were applied to the projected births to yield projection date populations in the two youngest age groups.

INSTITUTIONAL EFFECTS

The basic county trend projections produced for this series were modified for the growth of certain institutions. Institutions such as colleges, universities, military installations, and, to a lesser extent, prisons and some state hospitals house persons of particular age groups. These populations will substantially grow or decline only by administrative action. There are seven counties in North Carolina the age structure of which is significantly affected by institutions. These counties are Craven (military), Cumberland (military), Jackson (university), Onslow (military), Orange (university), Pitt (university), and Watauga (university).

PROJECTION CONTROLS

The county projections for April 1990 were forced to sum to county totals derived from extrapolation of the 1980 to 1986 growth implied by the 1986 county estimates. The entire set of projections for April 1990 was forced to sum to state race-sex totals derived from an independently produced state-as-one-unit projection (same basic Adjusted Migration technique) which incorporated 1970 census undercount adjustments at the state level.

Both the April 2000 and the April 2010 sets of projections were forced to sum to state age, race, and sex totals from independently produced state-as-one-unit Adjusted Migration projections.

USER NOTES

The fact that the county and state projection numbers for this series are presented in unrounded form does not imply that they are accurate to the last digit. Trend projections are accurate only to the extent that the future repeats the past.

NORTH CAROLINA POPULATION PROJECTIONS: 1988–2010

NORTH CAROLINA OFFICE OF STATE BUDGET AND MANAGEMENT
MANAGEMENT AND INFORMATION SERVICES

This publication presents a new series of county and state population projections completed in July 1988. The new series is a revision of the projection series completed in June 1987 and differs from it in two major ways. First, the national set of birth rates to which North Carolina rates are indexed was changed between 1987 and 1988, resulting in much lower national and North Carolina birth rates. Second, for the 1988 projection series the county projection totals for April 1990 were derived from extrapolating the 1980-1987 growth implied by the 1987 county estimates. Previously, growth based on the 1986 county estimates was used. This change increased the projected total state population for April 1990 by about 11,600 over the 1987 projection, increasing the totals for some counties and decreasing them them for others.

There were also several minor differences between the 1987 projection series and the current series. The national set of survival rates to which North Carolina's survival rates are converged changed somewhat between 1987 and 1988, with life expectancies for males increasing and those for females generally decreasing. Numbers of births for North Carolina for 1986 by age and race of mother were added to the base data for the 1988 series. A new University of North Carolina Long Range Plan was used to estimate "institutional" population growth where such populations were part of the University System. In addition, growth factors were estimated for the first time for other "institutional" populations, the largest effect of which was to show losses for military populations since 1980.

The fundamental basis for these projections has not changed. It is still the population base reported in the 1980 federal census, and the "aging forward" of this base still dominates these age, race, and sex specific projections. The median age is rapidly increasing, moving from 26.5 in 1970 to 32.6 in 1988, and is projected to reach 39.7 by 2010. This effect causes projected births to rise and then fall despite fairly constant fertility. Further, it causes projected deaths to increase rapidly despite improving mortality. Only the assumption of fairly constant net in-migration is not affected by the steadily climbing median age.

BIRTH ASSUMPTIONS

North Carolina's total white and nonwhite fertility rates are significantly less than the national averages. If child-bearing by women of all ages continues at its current (1985) rate, the average white woman in North Carolina will have 1.56 children during her lifetime and the average nonwhite woman will have 1.87 children

during her lifetime. The corresponding averages for the nation are 1.75 for whites and 2.17 for nonwhites.

It is assumed that for each age and race group the current ratios of state to national fertility will remain constant through the year 2010. Based on this assumption, the 1990, 2000, and 2010 birth rates for North Carolina were calculated from the projected birth rates for the United States (unpublished data from new national projection series), using the category "black" to correlate to the state's nonwhite population. These rates indicate that during the next twenty-five years white fertility for both North Carolina and the nation is projected to increase slightly, yielding averages for lifetime children per white female of 1.57 for North Carolina and 1.79 for the nation as a whole by the year 2010. Nonwhite fertility is projected to decrease somewhat, yielding averages for lifetime children per nonwhite female of 1.74 for North Carolina and 2.04 for the nation by the year 2010. In spite of these changes in projected fertility, both white and nonwhite births are expected to peak in the late 1980's and early 1990's, as the effect of the "baby-boom" cohorts moving through their prime child-bearing years dominates any changes in fertility.

North Carolina Total Fertility Rates
Centered on October 1

	1980	1985	1990	1995	2000	2005	2010
White	1.496	1.557	1.558	1.561	1.564	1.568	1.572
Other	1.925	1.873	1.854	1.826	1.799	1.774	1.748

DEATH ASSUMPTIONS

In general, North Carolina death rates are slightly higher than those for the nation as a whole; however, for young women of all races the state's death rate is slightly lower. Over the next century, North Carolina death rates are expected to converge toward national rates, reaching full equality by the year 2080. This assumption was used to develop projected survival rates for North Carolina from 1980 North Carolina survival rates and projected United States survival rates (unpublished data from new national projection series). For the nation as a whole, life

North Carolina Current and Projected Life Expectancies

Year	W-Male	W-Female	O-Male	O-Female
1970	66.756	75.706	58.820	67.805
1980	70.015	78.533	63.663	73.582
1990	72.043	79.870	67.382	75.662
2000	73.447	81.110	69.660	77.625
2010	74.365	81.918	71.268	79.017

expectancy at birth is projected to increase by more than three years from 1980 to the year 2010, as death rates drop significantly in all age, race, and sex groups. North Carolina will mirror this improvement. However, the number of deaths in the state will continue to rise, as the moving of the population into higher risk age groups dominates the improvement in age-specific mortality.

MIGRATION ASSUMPTIONS

Net migration to North Carolina is projected to follow recent experience (1980-1987). During the 1980's, 1990's, and the first decade of the next century, net migration into the state should average approximately 40 thousand per year, with the numbers being slightly larger for the 1990's and slightly smaller for the 2000's.

North Carolina Population Growth from 1970 to 2010

Decade	Begin Pop.	Growth	Births	Deaths	Nat. Gr.	Net Mig.
1970-1980	5,237,248	643,167	861,595	463,618	397,977	245,190
1980-1990	5,880,415	732,976	871,032	538,961	332,071	400,905
1990-2000	6,613,391	647,395	871,826	628,633	243,193	404,202
2000-2010	7,260,748	515,231	843,107	723,767	119,340	395,891

METHODOLOGY

Basic Trend Projections By County

The basic technique used to develop county trend projections by age, race, and sex for this series is the Adjusted Migration technique. The first step in this procedure is to obtain survived net migration for the base decade. This is done by determining a "cohort survived" population (which assumes no net migration during the base decade) for the end of the base decade by applying survival rates to the population at the beginning of the base decade. County deviations from state survival rates during the 1970-1980 decade are assumed to continue unchanged throughout the projection period. Then the cohort survived population is subtracted from the population at the end of the base decade to get the desired survived net migration.

The next step is to adjust this survived net migration for the base decade to yield a survived net migration for the projection decade. The adjustment procedure has two branches. If the survived net migration for a given age, race, and sex group is in-migration, then it is adjusted only for differences in mortality between decades. If it is out-migration, then the survived net migration is adjusted both for mortality differences and for the change in population between the beginning and end of the base decade.

There are two final steps. First, a cohort survived population is calculated for the projection date in a manner similar to that used to calculate the cohort survived population for the end of the base decade. Then, the survived net migration for

the projection decade is added to this population to yield the final projected population.

This technique cannot be used to project the populations of the two youngest age groups (0-4 and 5-9). For these age groups two steps are used. First, births by race and half decade are obtained by applying projected age- and race-specific birth rates for each year to projected numbers of women of child-bearing ages. It is assumed that deviations in individual county birth rates from the corresponding state birth rates between 1975 and 1985 will continue until the year 2010. Second, sex-at-birth ratios and projection ratios are applied to the projected births to yield projection date populations in the two youngest age groups.

Institutional Effects

The basic county trend projections produced for this series were modified for the growth of certain institutions, such as colleges, universities, military installations, and, to a lesser extent, prisons and some state hospitals, all of which house persons of particular age groups. These populations will substantially grow or decline only by administrative action. There are thirteen counties in North Carolina in which the age structures are significantly affected by institutions: Craven (military), Cumberland (military), Durham (university), Guilford (university), Harnett (university), Jackson (university), Onslow (military), Orange (university), Pasquotank (university), Pitt (university), Wake (university and prisons), Watauga (university), and Wayne (military).

Projection Controls

The county projections for April 1990 were forced to sum to county totals derived from extrapolation of the 1980 to 1987 growth implied by the 1987 county estimates. The entire set of projections for April 1990 was forced to sum to state race-sex totals derived from an independently produced state-as-one-unit projection (using the same basic Adjusted Migration technique) which incorporated 1970 census undercount adjustments at the state level. Both the April 2000 and the April 2010 projections were forced to sum to state age, race, and sex totals from independently produced state-as-one-unit Adjusted Migration projections.

USER NOTES

For a more detailed presentation of the methodology behind these projections, consult the forthcoming publications "N. C. Population Projections: Assumptions and Methods" and "N. C. Population Projections: Detailed Methodology" prepared by the Demographics Unit of the Management and Information Services Section, Office of State Budget and Management. The fact that the county and state projection numbers for this series are presented in unrounded form does not imply that they are accurate to the last digit. In general, trend projections are accurate only to the extent that the future repeats the past.
